GENERAL INFORMATION:

GENERAL INFORMATION:

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster

FILE REFRENCE: File Reference: 7326-094

CURRENT APPLICANT: NUMBER: US/09/270,767

NUMBER OF SEQ ID NOS: 62517

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 1693

LENGTH: 472

TYPE: DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             74 AspProValAspThrProAsnProThr------

Detecting and identifying ovarian tumor, identifying increased risk for developing ovarian cancer, and determining effectiveness of ovarian cancer treatment, by measuring expression level of ovarian tumor marker 2001-626450/72. P-PSDB; ABB50282

23; Page 98; 140pp; English. Claim

gene.

The invention relates to methods for diagnosing and prognosing ovarian tumours in an individual via the detection and measurement of the expression of ovarian tumour marker genes (ABA83081-ABA83122, ABA83180,

ABA83182 and ABA83184) or segments thereof (ABA83123-ABA83169, ABA83179, ABA83181 and ABA83183). The methods of the invention are useful for detecting an ovarian tumour in a patient, for identifying an individual at increased risk for developing ovarian cancer, in prognostic tests for assessing the relative severity of ovarian cancer, in tests for monitoring a patient in remission from ovarian cancer, in tests for constituting disease status in a patient being recated for ovarian cancer. The monitoring disease status in a patient being treated for ovarian cancer. The methods can additionally be used to identify a particular tumour as being an ovarian tumour (i.e., an epithelial ovarian tumour selected from serous cystadenoma, borderline serous tumour, mucinous cystadenocarcinoma, endometrioid carcinoma, undifferentiated carcinoma, cystadenocarcinoma, cystadenofibroma, adenofibroma and Brenner tumour. The ovarian tumour marker genes of the invention were identified cusing SAGE (serial analysis of gene expression) and were found to be overexpressed in a broad variety of ovarian epithelial tumour cells implicated in immune response pathways, in the regulation of cell implicated in immune response pathways, in the regulation of cell consider an epithelial calls. The marker genes are membraned in protein folding, and many of these are membraned considered in a protein folding to their weep as diagnostic and considered in a protein folding the page of the server membrane. prognostic markers, the ovarian tumour marker genes or their encoded proteins may be used as therapeutic targets for the treatment and prevention of ovarian cancer. Sequences ABA831081-ABA83122, ABA83180, ABA83182 and ABA83184 represent the ovarian tumour marker genes of the nvention

New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis or diabetes, and in chromosome mapping, tissue typing or pharmacogenomics

Claim 20; SEQ ID NO 141; 211pp; English.

This invention relates to novel NOVX proteins, and the DNA sequence which physiological responses in a cell, a tissue, an organ or an organism. Compounds which modulate the proteins of the invention may have cardiant, antiarteriosclerotic, hypotensive, cytostatic, anorectic, antirheumatic, antiarthritic, antidiabetic, nephrotropic, dermatological, immunosuppressive, anti-HIV, antiplammatory, neuroprotective, no notropic, antipsoriatic, a

```
associated with a human disease. The invention may be useful in diagnosing, treating or preventing NOVX-associated disorders, for example cardiomyopathy, atherosclerosis, hypertension, cancer, obsesity, rheumatoid arthritis, diabetes, glomerulonephritis, psoriasis, skin disorders, AIDS, inflammation, multiple sclerosis, Alzheimer's disease, Parkinson's disease, asthma, schizophrenis, depression, allergies or fertility disorders. The nucleic acids may further be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence is the cDNA sequence which encodes the human NOVX27a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      81 ProThrArgArgLysProGlyLysCysProValThrTyrGlyGlnCysLeuMetLeuAsn 100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120

They are esp. suitable for administration as spray or inhalation. The expression control sequence on the DNA fragment in AAN7028 is bound to the 5' end of HUSI cDNA in an expression vector.                                                                                                                                                                                                                                                                                             The present invention relates to a method (M1) for determining the subtype of leukaemia cells and whether a patient sample contains leukaemia cells. The method comprises determining the expression profile of a group of markers in a patient sample. The method is useful for determining the presence of leukaemia cells, its types or subtypes, and for the preparation of a medicament for treating leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   20

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a method for treating endometriosis in a subject, comprising administering to the subject an amount of antileukoprotease (ALP) effective to inhibit the activity of elastase or cathepsin G, thereby inhibiting ectopic implantation of endometrial fragments. The present sequence is the coding sequence for human ALP. ALP proteinase inhibitor (SLPI) and alphalproteinase inhibitor (SLPI) and alphalproteinase inhibitor (alphal-PI). ALP plays an important role in the defence of epithelial surfaces against proteolytic damage

The present invention relates to a new method for assessing whether a patient is afflicted with ovarian cancer. The method involves comparing the expression level of a marker in a patient sample and the normal level of expression of the marker in a control non-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the capteristing cancer, in detecting the presence of cancer as early as possible, and the recurrence of ovarian cancer. The method may also be of particular use with patients having an enhanced risk of developing ovarian cancer (e.g. patients having an enhanced risk of developing cancer). The cancer markers may be used in the management and treatment cancer. The cancer markers may be used in the management and treatment of e.g. brain and central nervous system disorders (e.g. bacterial and viral meningitis Alzheimer's a disease or Parkinson's disease), brain chisamations (e.g. bacterial or viral meningitis or encephalitis), inflammations (e.g. bacterial or viral meningitis or encephalitis), connective tissue disorders (e.g. nontuberculous grannlomations or atherosclerosis). The compositions and methods may also be used in assessing the histological type of neoplasm associated with ovarian cancer, monitoring the progression of ovarian cancer, monitoring the progression of ovarian cancer, monitoring the progression of ovarian cancer, seeseing the ovarian cancer has metaterasized or is likely to metastasize, selecting a composition for inhibiting ovarian cancer, assessing the ovarian cancer has metaterasized or is likely to researce of the ovarian cancer markers described in the progression of earner or at risk of developing ovarian cancer. The present nucleic acided the control of the ovarian cancer markers described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  nvention

The present invention describes a method (M1) for screening for an antinophastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in comprises at least one gene (1) of a signature gene set, where (I) comprises a sequences (S) selected from 8447 sequences (given in ABL6164 comprises in indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prosette or pancreatic cancer, adenocarcinoma, carcinoma, class cell carcinoma, neuroendocrine carcinoma, pand will....
                                                                                                                                                                                                                                                                                                                                                                                                                       carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tumour

The present invention describes a method (MI) for screening for an antineoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 847 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is

the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breat, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating ductal cancer, midiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                         318

The invention relates to diagnosing an inflammatory lung disorder in a mammal, comprising comparing the expression of a nucleic acid encoding an antileukoprotease polypeptide in mammal-derived cell population, and expression of a nucleic acid encoding the antileukoprotease in an inflammation positive or negative reference profile. Also disclosed are a computibing providing a compound that inhibites lung inflammation comprising providing a call expressing antileukoprotease, contacting the compound inthe cell, where a decrease in expression of antileukoprotease in the cell, where a decrease in expression in the call with a test compound compared to that in the absence of the test compound compared to that in the absence of the test compound inhibits lung inflammation. Also cancer computed is assessing prognosis of a mammal with a cancer or a thyroid tumour, comprising measuring the expression of a nucleic acid encoding the antileukoprotease in a mammal with expression of a nucleic acid encoding the antileukoprotease in a cancer reference profile; where a substantial similarity between the expression of the nucleic acid condending the antileukoprotease in a cancer reference profile; acid encoding the antileukoprotease in a cancer reference for diagnosing an inflammatory lung disorder such as emphysema, asthma, contributing antileukoprotease. The compound is useful for treating corrections an inflammatory disease in a mammal, preferably human, by inhibiting antileukoprotease. The compound employed in the method binds the natileukoprotease neared; and is a mammal antileukoprotease neared; and is a mallergy in a mammal and is a mallergy in a mammal and is a mammal. The compound is useful for a mammal correction and antileukoprotease neared, and is a antileukoprotease neared, and is a antileukoprotease. The compound and encoded in the method binds of the antileukoprotease neared, and is a antileukoprotease.
                                                                                                                                                                                                                                                                                                           Diagnosing inflammatory lung disorders by comparing expression of nucleic acid encoding antiliquor polypeptide in mammal-derived cell population to nucleic acid encoding the polypeptide in reference profile.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       78
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antibody, or antileukoprotease antisense nucleic acid. The methods are useful for assessing the prognosis of a mammal with thyroid carcinoma, ovarian carcinoma or renal cell carcinoma. The present sequence is a cD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MetLysSerSerGlyLeuPheProPheLeuValLeuLeuAlaLeuGlyThrLeuAlaPro

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to methods of diagnosing breast cancer in a patient, which comprise detecting the level of expression in a tissue sample of two or more genes selected from those shown in ABT09867-ABT1112, where a differential expression of the genes indicates breast cancer. The methods are useful in diagnosing, treating, detecting the progression, and in monitoring treatment of breast cancer in patients. The methods are also useful as a screening tool for agents that modulate the onset or progression of breast cancer. The breast cancer genes may be used as diagnostic markers for the prediction or identification of the malignant state of breast tissue, for confirming the type and progression of cancer, and for drug screening and assays. The present sequence is a coding sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in

The present invention describes a method for assessing whether a patient is afflicted with breast cancer. The method comprises comparing the level of expression of a marker (gene/polypeptide see ACCS0076 to ACCS0334 and ABR47386 to ABR47632) in a patient sample and the normal level of expression of the marker in a control non-breast cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level is an indication that the patient is afflicted with breast cancer. The breast cancer associated sequences from the present invention have cytostatic activities and can be used in gene therapy. The method is useful for diagnosing and treating breast cancer. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to newly discovered cancer markers associated with the cancerous state of prostate cells. Also disclosed is a method of the cancerous state of prostate cells. Also disclosed is a method of of the invention involves assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level of expression of the marker in the patient sample and the normal control indicates that the patient is afflicted with prostate cancer.

Nucleic acids of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequences given in the patient for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at they wipo int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            resecrerereaasecricresaaasrecricaaasereseasicrererecreraasaaarer 138

                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to novel NOVX proteins, and the DNA sequence which encode them, having properties related to stimulation of biochemical or physiological responses in a cell, a tissue, an organ or an organism.

Compounds which modulate the proteins of the invention may have cardiant, antiarteriosclerotic, hypotensive, cytostatic, anorectic, antirheumatic, antiarteriosclerotic, hypotensive, cytostatic, anorectic, antirheumatic, immunosuppressive, anti-HIV, antiinflammatory, neuroprotective, neuroleptic, immunosuppressive, antipartinonian, antiasthmatic, neuroleptic, nootropic, antipartinonian, antiasthmatic, neuroleptic, antidepressant, antiallergic or gynaecological activities. The DNA sequences of the invention may be useful for gene therapy whilst the protein sequences of the invention may be useful in a sesociated with a human disease. The invention may be useful in dispersion, treating a syndrome associated with a human disease. The invention may be useful in charmanic dispersion, allergies or cardiomyopathy, atherosclerosis, hypertension, cancer, obesity, theumation, multiple sclerosis, Alzheimer's disease, cardiomyopathy, atherosclerosis, hypertension, depression, allergies or theumatori arthritis, postiasis, skin disperse, and pharmacogenomics. The present sequence is the cDNA sequence medicine, and pharmacogenomics. The present sequence is the cDNA sequence which encodes the human NOVX27b protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis or diabetes, and in chromosome mapping, tissue typing or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     78

The method comprises determining the expression profile of a group of markers in a patient sample. The method is useful for determining the presence of leukaemia cells, its types or subtypes, and for the preparation of a medicament for treating leukaemia.

polynuciationed in the specification. The combination is useful as an extray element in a microarray for monitoring the expression of a number of target polynucleotides. The microarray is particularly useful in the diagnosis and treatment of cancer and immunopathology and neuropathology. The microarray is particularly useful in the diagnosis and treatment regimens, drug discovery and development, toxicological and carcinogenicity studies, forensics and pharmacogenomics. The microarray is also useful for monitoring progression of diseases and for developing sophisticated profiles for the effects of currently available therapeutic drugs. The combination is also useful for purifying a subpopulation of mRNMs, cDNMs and genomic fragments and in research and diagnostic applications. The array can detect changes in expression in a large number of genes coding for different signaling pathway populations which can be used to diagnose various diseases including cancer e.g. adenocarcinoma and leukaemia, immunopathies e.g. AlDS and asthma, neuropathies e.g. Alzheimer's disease and parkinson's disease. The present sequence represents a polynucleotide form part of the printed specification but was obtained in electronic formed directly from USPPO at sequence. html?DocID=06500938B1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ovarian cancer-related DNA #326 with altered ovarian cancer expression.

                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like tumor by: (1) determining a pattern of expression in the ovarian tumor of several markers given in the specification, and (2) comparing a similarity of the pattern of expression of the markers in the ovarian tumor to a pattern of expression of the markers in the ovarian tumor to a pattern of EXPR-2-like or non-BRCA-like tumor. The method is useful for classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence corresponds to an ovarian cancer -related gene having an altered pattern of expression in ovarian cancer. (Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from WIPPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ProThrArgArgLysProGlyLysCysProValThrTyrGlyGlnCysLeuMetLeuAsn 100

The invention relates to a novel method for diagnosing and analysing autoimmune disease or arthritides. The method comprises obtaining a autoimmune disease or arthritides. The method comprises obtaining a patient is a gene expression using the mRNA that results in a gene expression signature of the mRNA, and using that cor arthritides in the patient, where gene expression of at least 60% of cor arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene expression of at least 60% of cor arthritides in the treatment of rheumatoid arthritis; identification of corner than a mouse; diagnosis of rheumatoid arthritis; identification of array or gene chip, specific for rheumatoid arthritis; diagnosis or array or gene chip, specific for rheumatoid arthritis; acreening the efficacy of a candidate drug in vitro for the treatment of collagence of authorimune disease or rheumatoid arthritis; acreening the compositions of the invention have the following activities: immunosuppressive, antirheumatic, antiantition are useful for antipout, antinflammatory, dermatological, and immunomodulatory. The disease or arthritis arthrition are useful for methods and compositions of the present invention are useful for an entering and treating antirelyments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diagnosing and treating autoimmune disease or arthitides, such as rheumatoid arthritis, lupus, ankylosing spondylitis, fibrositis, fibromyalgia, osteoarthritis, gout, juvenile rheumatoid arthritis, and an immune disease caused by an infectious agent. This polynucleotide represents a DNA sequence relating to the genes used in the analysis and treatment of autoimmune diseases or arthritides. Note: This sequence is not shown in the specification. It has been supplied in an electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       autoimmune disease; arthritide; gene expression analysis; rheumatic; arthumatoid arthritis; ocllagen-induced; immunosuppressive; antirheumatic; antiarthritic; osteopathic; antigout; antiinflammatory; dermatological; immunomodulatory; lupus; ankylosing spondylitis; Ribrositis; fibromyalgia; osteoarthritis; gout; juvenile rheumatoid arthritis;

The invention relates to a composition of polynuclectide probes comprising first polynuclectide probes comprising at least a portion of a gene encoding a receptor-like polypeptide, second polynuclectide probes comprising at least a portion of a gene encoding at least a portion of a gene encoding an effector-like polypeptide. The probes of the composition are useful as array elements in a microarray for monitoring the expression of target polynuclectides. The microarray for monitoring the expression of target polynuclectides. The microarray for monitoring che expression of target polynuclectides. The microarray is useful in the diagnosis and treatment of cancer, an immunopathology or a contropathology. It can also be used for drug discovery and development, toxicological and carcinogenicity studies, forensics or pharmacogenomics. Microarrays can also be used for monitoring the progression of diseases that may be associated with the altered expression of signalling pathway polypeptides. The composition can also be used to purify a subpopulation of makNa, cDNNa, or genomic fragments in a sample. The expression profile is also useful for the diagnosis and treatment of cancer, e.g. cancers of the adrenal gland, bladder, bone, bone marrow, brain, breast or cervix, an immunopathology, e.g. Albs, disbetes, pancreatitis, osteoporosis or ulcerative colitis, or a neuropathology, e.g. dementia, amnesia, chims patent did not form part of the printed specification but was for obtained in electronic format directly from USPTO at

The method comprises comparing the level of expression of a marker (gene/polypeptide see ACCS0076 to ACCS0334 and ABR47386 to ABR4738 in a patient sample and the normal level of expression of the marker in a control non-breast cancer sample, where a patient sample and the normal level of expression of the marker in the patient sample and the normal level is an indication that the patient is afflicted with breast cancer. The breast cancer associated sequences from the present invention have cytostatic activities and can be used in gene therapy. The method is useful for diagnosing and treating breast cancer. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Breast cancer diagnosis or treatment by comparing the level of exproof a marker in a patient sample with that in the control non-breast cancer sample.

The invention relates to a method of detecting an ovarian cancer-
associated transcript in a cell from a patient, by contacting a
pological sample from the patient with a polymorieotide that selectively
hybridizes to a sequence at least 80% identical to any of one of 80
nucleic acid sequences given in the specification. The method is useful
Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                          Claim 10; Page 327; 332pp; English.

                                                                                                                                                                                                                                                                                                                                                                             82
in diagnosing ovarian cancer and in identifying and using agents and/or targets that inhibit ovarian cancer. The mucleic acid molecule, polypeptide and the antibody may also be used in detecting ovarian cancers, monitoring and early detection of relapse following treatment, monitoring response to therapy, selecting patients for post-operative chemotherapy or radiation therapy, in selecting mode of therapy, detection of the processing and as vaccines. This sequence corresponds to one of the nucleic acids
                                                                                                                                                                                                                                                                                                                                             MetLy8SerSerGlyLeuPheProPheLeuValLeuLeuAlaLeuGlyThrLeuAlaPro

The invention relates to a novel method for diagnosing and analysing autoimmune disease or arthritides. The method comprises obtaining a C autoimmune disease or arthritides. The method comprises obtaining a c patient sample conteaining mRNA, analysing gene expression using that that results in a gene expression signature of the mRNA, and using that c comprises: a treatment of the gene expression of at least 60% of the genes correlates with that of the gene expression of at least 60% of the genes correlates with that of the gene expression of a least 60% of the genes correlates with that of the gene expression of a least 60% of the genes correlates with that of the gene expression of a least 60% of the genes for targeting in the treatment of the invention of array or gene chip, specific for fleumatoid arthritis; diagnosis or array or gene chip, specific for fleumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; accening the efficacy of a candidate drug in vitro for the treatment of collagentinduced arthritis. The compositions of the invention have the following activities: immunosuppressive, antirheumatic, antiantides, such as activities: immunosuppressive, antirheumatic, antiantides, such as activities and compositions of the present invention are useful for methods and compositions of the present invention are useful for diagnosing and treating autoimmune disease or arthritides, such as the rheumatoid arthritis, lupus, ankylosing spondylitis fibromytalgia, osteoarthritis, gout, juvenile rheumatoid arthritis, and educing to the genes used in the analysis and treatment of autoimmune disease caused by an infectious agent. This sequence is immune disease caused by an infectious agent. This polymulescitie, represents a DNA sequence relating to the genes used in the analysis and creatment of autoimmune diseases or arthritides. Note: This sequence is an entered and an analysis and treatment of autoimmune diseases or arthritides. Note: This sequence is an entered and an an entered a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method for the use of genes and proteins for diagnosing ovarian cancer and/or a likelihood for survival cor recurrence of the disease, where the expression of genes and proteins is up-regulated and down-regulated or associated with the occurrence or recurrence of a specific cancer sub-type. Also described: (1) detecting an ovarian cancer in a human or animal subject being tested; (3) detecting an ovarian cancer in a human or animal subject being tested; (3) detecting an ovarian cancer in a human or animal subject being tested; (3) detecting an ovarian cancer; and (6) an assay device for use in the diagnosis of row an ovarian cancer; and (6) an assay device for use in the diagnosis of ovarian cancer comprising polynucleotides or antibodies immobilised to a solid phase, where each of the antibodies binds to a gene given in the specification and each of the antibodies binds to a solid phase, where each of the antibodies binds to a solid phase, where each of the antibodies binds to a solid phase, where each of the antibodies binds to a solid phase, where each of the antibodies binds to a solid phase, where each of the antibodies consists of a polypoptide also given in the specification and each of the antibodies consists of a polypoptide dealso given in the reatment of ovarian cancer associated sequence has cytostatic activity, and can be used in gene therapy. An ovarian cancer section of a medicament for the treatment of ovarian cancer or for the preparation of a medicament for the treatment of ovarian

cancer. The ovarian cancer that is diagnosed is an epithelial ovarian cancer selected from serous ovarian cancer, non-invasive ovarian cancer, mixed phenotype ovarian cancer, mucinous ovarian cancer, endometrial ovarian cancer, papillary serous ovarian cancer, Serous ovarian cancer, Benner cell ovarian cancer, papillary serous ovarian cancer, Brenner cell or undifferentiated adenocarcinoma. The present sequence encodes human secretory leukocyte protease inhibitor (SLPI), which is located on chromosome 20 and is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     143 GCCCAGTGCCTTAGATACAAGAAACCTGAGTGCCAGAGTGACTGGCAGTGTCCAGGGAAG

                                                                                                                                                                                                                                                                                                                               82
                                                                                                                    The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polynucleotides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                      LysArgCysCysProAspThrCysGlyIleLysCysLeuAspProValAspThrProAsn

This invention describes novel nucleic acid (cDNA) sequences (A) which have anticancer activity and are highly expressed in ovarian tumor tissue (and some also in testis and breast canner tissue). The products of the invention can be used for gene theasy. (A) are used (i) for recombinant expression of polypeptides (B) and (ii) to isolate complete genes. (B) are used (i) to identify agents suitable for treatment of ovarian cancer; (ii) directly for treating this form of cancer (including expression from gene therapy vectors) and (iii) for generation of specific antibodies. (A) are identified by assembling ESTS (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This are blown a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTS from different libraries may represent different parts of the same cunnown gene, discorting the estimated frequency of occurrence in a particular tissue. Ad277450-Z77572 represent the human ovarian tumor CDNA library derived EST fragments represented in AAY76505-Y76638
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    194 AAGAGATGTTGTCCTGACACTTGTGGCATCAAATGCCTGGATCCTGTTGACACCCCCAAAC 253

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAH57161 to AAH57576 represent cell and tissue specific polynucleotide sequences (I). (I) can have cytostatic, immunomodulatory and neuroprotective activities, and can be used in gene therapy. (I) and proteins (II) encoded by then are used in high throughput screening assays to select DNA molecules, RNA molecules, peptides nucleic acids, mimetics, peptides, proteins, agonists, antagonists, antibodise or their fragments, immunoglobulins, inhibitors, drug compounds and pharmaceutical agents. Expression of (I) in a sample indicates the differentiation of embryonic stem cells into a tissue selected from brain, heart, kidney, liver, lung, skeletal muscle or pancreatic tissues. (I) and (II) are used to produce an expression profile that defines a metabolic or developmental process, treatment, condition, disease or disorder. The condition disease or disorder. The treatments and for investigating a predisposition to a disorder where the gene is associated with a cancer, immunopathology or neuropathology

The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-acacerous) ovarian cells. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the polypeptides, a method of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient affiliated with ovarian cancer comprising providing to cells of the patient an antisense oligonucleotide complementary to a marker of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; SEQ ID NO 20587; 106pp; English

invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of a marker in a control non-ovarian cancer sample. A difference between the expression levels indicates ovarian cancer. The level of expression of a marker corresponds to a secreted protein or to a transcribed comparing the presence in the sample, a protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein Alternatively, the level of expression of the marker is assessed by detecting the presence of a transcribed or protein or protein comprising the marker, under stringent conditions. The marker is also used for monitoring the progression of ovarian cancer in a patient sample at a first point in time, repeating the method at a subsequent time and comparing the level of expression. The method at a subsequent time and comparing the level of expression. The method at a subsequent time and comparing the level of expression. The method at a subsequent or using an ovarian tissue sample. A composition comprising a marker. This sequence represents a human ovarian cancer DNA marker of the invention. Note: The sequence data for this patent did not form part of the muthod is the print of the muthod and in the control of the print of the marker and in the control of the marker and the control of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print o

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the construction of any of the 37 amino acid sequences fully defined in the construction of the invention has antidabletic, anotation, hypoteptide, protozoacide, nootropic, controctective, antibacterial, fungicide, protozoacide, nootropic, controctective, antibactarians, anticonvulsant, osteopathic, antibactarial parkinsonian, anticonvulsant, osteopathic, antistrathritic, antiinflammatory, dermatological, antisthmatic, and antibodies controllipaemic activity. A polynuclectide of the invention may have a use antistrathritic, antitinflammatory, dermatological, antisthmatic, and antibodies controllipaemic acid molecules, preferably a NOVA-associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such as metabolic disorders, ciabetes, obesity, infectious diseases (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (Nypertension, atherosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociarosociaros
                                                                                                 antiatreriosclerotic; anorectic; virucide; antibacterial; fungicide; protozoacide; nootropic; neuroprotective; antibacterial; fungicide; protozoacide; nootropic; neuroprotective; antibarkinsonian; dermatcological; antiasthmatic; antibaemat; gene therapy; fibroblast growth factor receptor 4; FGFR4; complement factor I precursor; metalloproteinase-15 precursor; MDC3; T-lymphocyte surface antigen Ly-9 precursor; fibroblast growth factor-21; FGF-21; alpha-2 macroglobulin-like polypeptide variant; antibackoptoteinase 1 precursor; LIV-1; nuclear hormone receptor NOR-1; transmembrane protein-like; beta-neoendorphin-dynorphin precursor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,

substances for use in therapeutic or diagnostic methods. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The NoVX polypetides of the invention show homology to certain known human proteins: NOV1a-1t show homology to fibroblast growth factor receptor 4 (FGFR4); NOV2a shows homology to complement factor i precursor; NOV3a shows homology to complement factor in precursor; NOV3a shows homology to matrix metalloproteinase-15 precursor; NOV4a shows homology to fibroblast growth factor-21 (FGF-21); NOV1a-7c show homology to alpha-2 marcoglobulin-like polypeptide variant; NOV8a-8g show homology to alpha-2 marcoglobulin-like precursor; NOV8a-9g show homology to alpha-2 marcoglobulin-like converser; NOV9a-9; show homology to LIV-1 protein; NOV1a shows homology to LIV-1 protein; NOV1a shows homology to LIV-1 protein; NOV1a shows homology to conclear hormone receptor NOR-1; NOV1a-11; show homology to beta-necendorphin transmembrane protein-like; NOV1a-12 show homology to beta-necendorphin contraction precursor. The present sequence encodes a NOVX polypeptide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ProProAsnPheCysGluMetAspGlyGlnCysLysArgAspLeuLysCysCysMetGly 120

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic, anorectic, cardiant, hypotensive, antiateriosclerotic, anorectic, cardiant, hypotensive, antiateriosclerotic, anorectic, cardiant, hypotensive, antiateriosclerotic, anorectic, cardiant, hypotensive, antiateriosclerotic, anorectic, cardiant, hypotensive, antiaterial, fundicide, protozoacide, nootropic, antiatrhritic, antinflammatory, dermatological, antiasthmatic, and antiaterial antiatrhritic, antinflammatory, dermatological, antiasthmatic, and antibodies care useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder.

The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such as metabolic disorders, diabetes, obesity, infectious diseases with as metabolic disorders, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atheroscalerosis), neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, epilepsy, immune disorders, Alzheimer's concentrations, and various dyslipidaemias. The nucleic acids and polypeptides may and various dyslipidaemias. The nucleic acids and polypeptides concentration, haematopoietic disorders, inflammatory skin disorders, asthma, and various dyslipidaemias. The nucleic acids and polypeptides concentration of antibodies that bind immunospecifically to NoVX substances for use in therapeutic or dispusostic methods. The NOVX substances for use in therapeutic or adiagnostic methods. The NOVX substances for use in therapeutic, and pharmacogenomics. The NOVX cubstances for use in therapeutic, and pharmacogenomics. The NOVX cubstances for use in therapeutic, and pharmacogenomics. NoVIa-1t show homology to certain known human probes, in chromosome mapping, proteins: NOVIa-1t show homology to certain known huma
fibroblast growth factor receptor 4; FGFR4; complement factor I precursor; matrix metalloproteinase-15 precursor; MDC3; T-lymphocyte surface antigen Ly-9 precursor; fibroblast growth factor-21; FGF-21; alpha-2 macroglobulin-11ke polypeptide variant; antileukoproteinase 1 precursor; LIV-1; nuclear hormone receptor NOR-1; transmembrane protein-11ke; beta-neoendorphin-dynorphin precursor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Rieger DK;

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic, anorectic, cardiant, hypotensive, antiarterioscleroric, anorectic, cardiant, hypotensive, antiarterioscleroric, anorectic, cardiant, hypotensive, antiarterioscleroric, anorectic, cardiant, hypotensive, antiarterioscleroric, anorectic, cardiant, hypotensive, anticonvulsant, osteopathic, antipartinsonian, anticonvulsant, osteopathic, and propertides, muclaic acid molecules and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The nucleic acid molecules in propertides and antibodies are useful for treating, preventing or disgnosing diseases such as metabolic disorders. Creating, preventing or disgnosing diseases such as metabolic disorders, dispetension, atherosclerosis), neurodegenerative disorders, Alzheimer's disease, parkinson's disease, epilepsy, immune disorders and various dyalipidaemias. The nucleic acids and ovarious dyalipidaemias. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurodegenesis, call differentiation, haematopoietic disorders, inflammatory skin disorders, proliferation, haematopoietic disorders, inflammatory in generation of antibodies that bind immunospecifically to NoVX captase for use in therapeutic or diagnostic methods. The nucleic acids are further used as hybridisation probes, in dromosome mapping, tissue typing, preventive medicine, and pharmacogenemics for use in therapeutic or diagnostic methods. The NoVX is substances for use in therapeutic or diagnostic methods to methods of the invention show homology to Certain knowled the invention show homology to certain knowled in the norely of precursor; NOV4s a shows homology to matrix metallophopeus antigen typingerides of the invention ender a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ly-9 precursor; NOV6a-6m show homology to fibroblast growth factor-21 (FGF-21); NOV7a-7c show homology to alpha-2 macroglobulin-like polypeptide variant; NOV8a-8g show homology to antileukoproteinase 1 precursor; NOV9a-9; show homology to LIV-1 protein; NOV10a shows homology to nuclear hormone receptor NOR-1; NOV11a-11j show homology to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic, cardiant, hypotensive, antiarteriosclerotic, anorectic, cardiant, hypotensive, antiarteriosclerotic, anorectic, antibacterial, fungicide, protozoacide, noctropic, neuroprotective, antiparkinsonian, anticonvulsant, osteopathic, antiarteritic, antimifarmantory, dermatological, antiasthmatic, and antibacterial, fungicide, protozoacide, noctropic, antiarteritic, antimifarmantory, dermatological, antiasthmatic, and antibodies are useful in the manufacture of a medicament for treating a syndrome consociated with a human disease, preferably a NOVX-associated disorder. Treating, preventing or diagnosing diseases such as metabolic disorders, diabetes, obesity, infectious diseases uch as metabolic disorders, catabuthic, and protozoal), anorexia, cancer, cardiovascular diseases (helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (helminthic, and subsence) and subsence of diseases (pilepsy) immune disorders, asthma, and various dyslipidaemias. The nucleic acids and polypeptides of that modulate or inhibit e.g. neurogenesis, inflammatory shin disorders, that modulate or inhibit e.g. neurogenesis, cell differentiation, and penartion of antibodies that bind immunospecifically to NoVX substances for use in therapeutic or diagnostic methods. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medaline, and pharmacogenomics. The NoVX substances for use in therapeutic or diagnostic methods. The NoVX substances homology to cortain known human proteins: NOV1a-1t show homology to certain known human proteins: NOV2a-brows homology to complement factor I precursor; NOV3a shows homology to complement factor I precursor; homology to complement factor I precursor; homology to proteins hom
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,
                                                                                                                                                                                                                                                                                                                                                                      Padigaru M, Rieger DK;

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the antenetion. A polypeptide of the invention has antidiabetic, ancectic, cardiant, hypotensive, antiarteriosclerotic, ancectic, rivulabacerial, fundicide, protozoacide, mootropic, antidiabacerial, fundicide, protozoacide, mootropic, antidiabamatory, dermatological, antiasthmatic, and antibacerial and antidakinant contropic, antidatinamatory, dermatological, antiasthmatic, and antibacerial and antidamatory, dermatological, antiasthmatic, and antibacerial cardiamatory, repeptides mucleic acid molecules and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The mucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or disglocating diseases such as metabolic disorders, disperts, inferctious diseases where it is an expectation, atheroaclerosis) neurodegenerative disorders, and protozoal), anocexis, inflammatory skin diseases (typertension, atheroaclerosis) neurodegenerative disorders, and protozoal), anocexis, inflammatory skin diseases (typertension, atheroaclerosis) neurodegenerative disorders, and protozoal), anocexis, inflammatory skin disease, conting and angiogenesis, and protozoal, and pharacogenesis, in the modulate or inhibit e.g. neurogenesis, cald and angiogenesis, in generation, haematopolisal, wound healing and angiogenesis, in the modulate or inhibit e.g. neurogenesis, et all differation, haematopolisal, wound healing and angiogenesis, in the content and proteins NOVIa-1t show homology to fibroblast growth factor receptor of eiges are typing, perventive medicine, and pharacogenemics. The NOVA shows homology to matrix metalloproceinases, in chromosome mapping prevented as hybrid, sender homology to antine homology to alpha-2 macropolulisations of the invention of antine how homology to fibroblast growth factor receptor (FGF2-21); 
                                                                                                                                                                                                                                                                                                                         New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections.
                                                                                                                                                                                                                          Rieger DK;

                                                                                                                                                                                          The invention relates to a method of inhibiting a cancerous phenotype of a cell comprises contacting a cancerous mammalian cell with an agent for inhibition of DKRZp5661133 activity. The methods are useful for treating cancer, e.g. breast cancer. This sequence represents a gene product which is differentially expressed in breast cancer cells. The sequence can be used in the method of the invention.

Observationary, nagamatopoletic disorders, intrammatory skin ausorders, asthma, and various dyslipidaemias. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that madulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to Novx substances for use in therapeutic or diagnostic methods. The nucleic caids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The Novx polypeptides of the invention show homology to certain known human proteins. Novia-1t show homology to fibroblast growth factor receptor (FGFR4); NOV2a shows homology to complement factor I precursor; NOV3a shows homology to fibroblast growth factor-21 (FGFR4); NOV2a show homology to fibroblast growth factor-21 (FGF-21); NOV3a-7c show homology to fibroblast growth factor-21 (FGF-21); NOV3a-7c show homology to fibroblast growth factor-21 (FGF-21); NOV3a-91 show homology to fibroblast growth factor-21 (FGF-21); NOV3a-91 show homology to fibroblast growth factor-21 (FGF-21); NOV3a-91 show homology to fibroblast growth factor-21 (FGF-21); NOV3a-91 show homology to fibroblast growth factor-21 cransmembrane protein-like; NOV3-12-12c show homology to beta-neoendorphin cransmembrane protein-like; NOV3-12-12c show homology to beta-neoendorphin dynorphin precursor. The present sequence encodes a NOVX polypeptide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic, anorectic, cardiant, hypotensive, antiatreriosclerotic, anorectic, curdiant, hypotensive, antiatreriosclerotic, anorectic, cardiant, hypotensive, anticonvulsant, osteopathic, neuroprotective, antipparkinsonian, anticonvulsant, osteopathic, antiatrhritic, antipirlammatory, dermatological, antiashmatic, and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such as metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, halmithic, and protozoal), anorexia, cancer, cardiovascular diseases (helmithic, and protozoal), anorexia, cancer, cardiovascular diseases (helmithic, and protozoal), neurodegenerative disorders, disease, parkinson's disease, epilepsy, immune disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,
                                                                                                                                                                                                                                                                                                                                            Padigaru M,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         à
                                                                                                                                                                                                                                                                              The invention relates to human novel polynucleotide and polypeptide sequences useful as reagents in forensic analyses, as chromosome markers, as tissue/cell/organelle-specific markers, in producing expression vectors, or in screening and diagnostic assays. The invention is used as reagents in screening and diagnostic assays for abnormal novel expression and/or biological activity, and in screening compounds that may be used in the treatment of novel-related disorders, e.g. neurological disorders. The novel gene is also used in gene therapy. The present sequence is human secretory leukocyte proteinase inhibitor variant (Sepin) cDNA, a

The invention relates to a method of classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor by: (1) determining a pattern of expression in the ovarian tumor of seweral markers given in the specification; and (2) comparing a similarity of the pattern of expression of the markers in the ovarian tumor to a pattern of expression of the markers in the ovarian tumor to a pattern of expression of the markers in a comparison tissue of a known BRCA-1-like or BRCA-1-like or non-BRCA-like tumor. The method is useful for classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor. This sequence corresponds to an ovarian cancer -related gene having an altered pattern of expression in ovarian cancer. (Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Liassirying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-sermining a pattern of expression in the ovarian tumor of several markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             347

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a DNA sequence (A) encoding an analogue of a mammalian serine protease inhibitor (B). The DNA sequences and recombinant methods allow manufacture of a class of inhibitors of e.g. cathepsin G, elastase, and trypsin, with different specificities. The recombinant serine protease product can be directed to act intracellularly or extracellularly and is useful in treating conditions caused by a disturbance in the native protease/protease inhibitor balance of such as emphysema, arthritis, gonerulonephritis, periodnitis, muscular dystrophy, tumour invasion, sepais, and acute leukemia. (A) allows (B) to be recombinantly produced in sufficient quantities and purities so as to provide economical pharmaceutical compositions. (B) is resistant to heat, cid, and a variety of proteolytic enzymes, is thermodynamically stable in extracellular conditions, and exhibits a high degree of self assembly trimily mhe process.

```
This invention relates to new purified and isolated mammalian serine protease inhibitors proteins which comprise at least 8 cysteine residues and no more than 107 amino acids. The protease inhibitors are capable of inhibiting chymotrypsin and elastese. Sequences AAC97526 - AAC97534, AAC97544 - AAC97534 and AAC97544 - AAC97534.

AAC97574 - AAC97581 and AAC97644 - AAC97641 represent DNA encoding the protease inhibitors of the invention, and include oligonucleotide sequences used in the isolation and characterisation of the proteins. Primers AAC97535 - AAC97538 - AAC97538 - AAC97631 are used in the construction of DNA encoding the protease inhibitors. Peptide sequences ABS3122 represent the protease inhibitors of the invention and various other peptides used in the isolation of the protease inhibitors. The serine protease inhibitor protein is useful for treating a protease mediated condition, which includes protease mediated tissue destruction, eg. emphysema, arthritis, glomerulonephritis, periodontitis, muscular dystrophy or tumour invasion. It is also useful for modulating protease activity. The DNAs are useful for producing the proteins, especially by
mediated condition or tissue destruction e.g. emphysema or tumor invasion and for recombinant production of inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 460 BP; 123 A; 114 C; 125 G; 98 T; 0 U; 0 Other;

The invention relates to a DNA sequence encoding an analog of a mammalian serine protease inhibitor protein. The analog comprises at least eight expetable residues and possesses serine protease inhibitor activity, and at least one operational element consisting of a promoter, an operator, terminator codon. The DNA is useful in recombinant DNA techniques for directing the production of a serine protease inhibitor protein, e.g. leukocyte elastase or trypsin. The present sequence represents the DNA sequence coding for ompA-secretory leukocyte protease inhibitor (SLPI)
                                                                                                                                                                                                                                                                                                                                                                           New DNA sequences, useful in recombinant DNA techniques for directing the production of a serine protease inhibitor protein, e.g. leukocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 MetLysSerSerGlyLeuPheProPheLeuValLeuLeuAlaLeuGlyThrLeuAlaPro

procease activity. The fusion protein of the invention is useful for inhibiting procease activity associated with a disorder such as emphysema, asthma, chronic obstructive pulmonary disease, cystic fibrosis, citiis media, otitis external or HIV infection, or for transitionary disease, cystic an individual suffering from or at risk for a disease or disorder involving unwanted procease activity. The proteins are useful for treating demandlogical diseases such as atopic dermatitis, eczema and psoriasis, in inflammatory responses to viral infection, and for treating herpes infection, corneal or epidermal ulceration, chronic non-healing wounds, sepsis, rheumatorid arthritis, periodontal disease, tumour metastasis and tumour angiogenesis, gastric ulceration, osteoporosis, Paget, a disease, uppertending and malarial bacterial infection, Alzheimer's disease, hypertendion and muscular dystrophy. The present sequence represents the DNA encoding the rSLAPI fusion protein of
